

Engineered Natural Stone & All Natural Stone Supplier

THE NATUREBLOCS MISSION

NatureBlocs's modernized and eco-friendly technique successfully blends the beauty of natural stone with cement-based binders to create a unique quality product that is versatile for all your commercial and residential design needs. We have captured the essence of natural stone while avoiding the high cost, limited sizing and selection options and quality issues inherent in natural stones such as breakage, cracking and color inconsistency.

Our engineered stones also surpass the quality of completely cement products which are hot to the touch whereas engineered stone stays cool. We use natural pigmentation from the mined stones which allows the colors to perpetually remain vivid instead of applying dyes and pigments used in solid cement which fade over time.

Not only do our engineered stones offer many advantages in quality over competing products but our streamlined manufacturing process allows for well-stocked inventory and expedited delivery. You no longer have to wait weeks or months for your order to be processed and manufactured, which is especially beneficial for large custom orders. With all the advantages of using our all natural and eco-friendly product, all your stone needs can now be met timely and efficiently.

Eco-friendly **natural** stones engineered for better design and better environment.

THE ENGINEERED STONE PROCESS

NatureBlocs offers terrazzo style engineered natural stones in an elegant, eco-friendly and versatile product suitable for all your building and design needs. We start by selecting a variety of quality natural stones and natural aggregates which are micronized and mixed with cement-based binders. Once blended, this customized mixture is shaped into blocks. This block casting technology, which favors naturalness and beauty, offers wide sizing and color options. After waiting for the settling and drying time of the block, it is cut by a gang saw and becomes a plate (slab). Our process with these plates then mirrors how we process non-engineered natural stone from resizing, finishes, packaging, and transporting. But due to its engineered method, our stone products produce less waste and more consistency while still offering color variations and the aesthetic of natural stone. Our process also allows for more streamlined transactions from sales to finished product and ultimately, higher customer satisfaction. Engineered natural stones can be used in all indoor/outdoor and commercial/residential environments for flooring, stairs and hardscapes.

SHERPA SAND

ENGINEERED TRAVERTINE

Traditional travertine gets a modern update with this eco-friendly product developed from genuine travertine fragments which are finely ground and blended with cement-based binders. This elevated travertine product retains its naturalness to suit your luxurious and elegant projects.

SPECKLED SUMMIT

ENGINEERED LIMESTONE

Calcite, dolomite and micronized marble powders in durable and dense limestone are mixed with cement-based binders to create this flattering and multipurpose design.

HILLSIDE HAZE

ENGINEERED MARBLE

We select quality marble and natural aggregates then carefully grind them before blending with cement-based binders resulting in this beautiful hazy gray.

- ✔ Eco-Friendly
- ✔ No Dyes or Pigments
- ✔ No Fading
- ✔ Less Waste
- ✔ No Cracks - Durable

- ✔ Better Quality & Color Consistency
- ✔ Stays Cool
- ✔ Resistant to Algae & Mildew
- ✔ Salt Pool Compatible
- ✔ All Stone Finishes Available

PRODUCT AND MAINTENANCE INFORMATION

Due to the natural stones used in our process, slight variations in pattern and color may exist. Sealing our products is optional but recommended for easy care and maintenance.

Our engineered stone pavers are resistant to mold and mildew and soap and water can be used for routine maintenance and also eliminate most organic stains. However, you may encounter stubborn non-organic surface stains that are a normal part of the packaging, shipping and installation process. These stains may require additional treatment such as light pressure cleaning, eco-friendly cleaners, chlorine, heavy duty cleaners and hydrochloric acid wash. We recommend consulting with stone/paver cleaning professionals prior to treatment and then following all product instructions.
